A: Another lightweight, open source program is BOMIT, that is unfortunately currently unmaintained. It's written in Haskell, so it's not very portable. I don't know if it's still available for download, but if you want to include Unicode characters in filenames it might be a good option. BOMIT describes itself as "a Haskell library for WordDecoding, Non ASCII character detection, and conversion to Unicode." A: I never got FileBOMDetector to work. A suggestion I found on the net: write a shellscrip with the grep command using as input the file paths you want to scan. For example: `grep -o '\xef\xbb\xbf' ${FILE1}` `grep -o '\xef\xbb\xbf' ${FILE2}` ... to find BOM in a txt file. The role of the endothelial cell-derived matrix metalloproteinase in human pulmonary microvascular endothelial cell invasion. Extracellular matrix remodeling is a necessary component of the tumor microenvironment. The remodeling mediated by metalloproteinases, including matrix metalloproteinases (MMPs), is responsible for the invasiveness of tumor cells. In this study, the endothelial cell-derived MMP was investigated for its ability to degrade extracellular matrix and its functional role in invasion of human lung microvascular endothelial cells (HMVECs). Matrix metalloproteinase-2 (MMP-2) and matrix metalloproteinase-9 (MMP-9) were examined by zymography, and their expression was examined by Western immunoblotting and immunocytochemistry. Purified recombinant MMP-2 and MMP-9 were examined for their ability to degrade human airway and pulmonary microvascular extracellular matrix. Each metalloproteinase was also evaluated for its ability to enhance cellular invasion of an endothelial monolayer. MMP-2 and MMP- b7e8df5c8
